Algae Alerts in the Barwon-Darling river system as of Thursday, 28 April 2005

	CURRENT ALERT LEVEL	PREDOMINANT BLUE- GREEN ALGAE GENERA [#]	PREVIOUS ALERT LEVEL
LOCATION			
Barwon River @ Mungindi	No current information		No current information
LOCATION	24 APRIL 2005		23 FEBRUARY 2005
Barwon River @ Collarenebri	NIL	No blue-green algae detected	NIL
Barwon River @ Walgett Dangar Bridge	MEDIUM	Phormidium Merismopedia	LOW
Namoi River @ Walgett	LOW	Anabaena	NIL
LOCATION	21 APRIL 2005		8 FEBRUARY 2005
Barwon River @ Brewarrina	NIL	No blue-green algae detected	NIL
LOCATION	21 APRIL 2005		1 MARCH 2005
Darling River @ Bourke	LOW	Anabaena	NIL
LOCATION	20 APRIL 2005		1 MARCH 2005
Darling River @ 'Rose Isle' 30km north east of Louth NSW	MEDIUM	Merismopedia Anabaena	LOW
Darling River @ Louth	LOW	Anabaena	LOW
LOCATION	20 APRIL 2005		9 FEBRUARY 2005
Darling River @ Tilpa	LOW	Oscillatoria	NIL
Darling River @ 'Trevallyn' 70km south west of Tilpa NSW	No current information		No current information
Darling River @ 'Atley' 10km east of Wilcannia NSW	No current information		No current information
Darling River @ Wilcannia	NIL	No blue-green algae detected	NIL
Darling River @ 'Culpaulin' 25km south west of Wilcannia NSW	No current information		No current information

[#] Only the two most frequently observed blue-green algae genera that contribute to the current alert level are presented above in order of their abundance. *There may also have been other blue-green algae genera present.* These data are presented for information only. We recommend that water treatment and stock management responses should not be altered according to the observed blue-green algae genera. All blue-green algae genera should be considered as potentially harmful to human and animal health when present in blooms.

Far West Algal Alert Report

Thursday, 28 April 2005

COMMENTS

No blue-green algae blooms were observed in Barwon-Darling river system on the stated sampling day. Medium alert levels are current for the Barwon River at Walgett and the Darling River at 'Rose Isle'. These levels indicate some potential for the development of BGA blooms in or around these areas in the near future.

River users and landholders are advised to avoid waters in areas subject to high and very high alert levels or with visible areas of algae scums. They should also consider either alternative sources of water or treatment of river water supply to remove algae and algae by-product. NSW Health advises that any domestic use of surface water without treatment should be avoided.

ALERT DEFINITIONS

High Alert (>15,000 cells/ml), Very high alert (>50,000 cells/ml)

These alert levels represent 'bloom' conditions. The water will appear green and may have strong, musty or organically polluted odours. The blue-green algae will be visible as clumps or as scums. Blue-green algae 'blooms' may be toxic to humans and animals. Toxicity should be assumed. People should avoid reaches where blue-green algae can be seen or which have a strong odour as previously described. Contact with or consumption of untreated water from the river should be avoided because of the risk of eye and skin irritations and stomach upsets. Boiling is not a suitable way of treating water containing blue-green algae and in fact may release more toxins. Filtration in conjunction with activated carbon is a more effective means of water treatment. Dogs and stock are particularly at risk from toxic blue-green algae blooms. Owners should keep dogs away from high alert areas and provide alternative watering points for stock.

Medium Alert (2,000-15,000 cells/ml)

Blue-green algae may be multiplying in numbers. The water may have a green tinge and musty or organic taste and odours. Alternative supplies of raw water for domestic purposes should be considered. Domestic water suppliers should institute taste and odour removal systems where available. The water may be suitable for recreational use, however people should be cautious as algal concentrations can increase rapidly.

Low Alert (<2,000 cells/ml)

Blue-green algae occur naturally at low numbers. At this concentration, algae do not pose a threat for recreational, stock or domestic use.

This blue-green algal alert report is based on routine monitoring by the Department of Infrastructure, Planning and Natural Resources and local Shire Councils. It should be noted that the presence and location of blue-green algae in the Barwon-Darling river system could vary considerably, according to water and weather conditions.
